

Cisco Voice Gateways

SANOG12 VoIP Workshop
Kathmandu, August 2008

Jonny Martin - jonny@jonnynet.net
Vicky Shrestha - vicky@pch.net

Voice Gateways

- Any device with one or more TDM PSTN interfaces on them
 - TDM - Time Division Multiplexing (i.e. traditional telephony)
 - PSTN - Public Switched Telephone Network
 - To be really useful, gateways also need an IP interface on them
- Many vendors, we'll concentrate on Cisco IOS based voice gateways
- Both analog and digital interfaces, we'll look at the more common ones

Interface Types - Digital

- ISDN primary rate circuits (there are others, but we will look at ISDN)
- E1 (primarily used in Europe and Oceania)
 - 2 Mbit/s bearer
 - 32x 64kbit/s channels. 30 for voice, 1 for signalling (timeslot 16), 1 framing
- T1 (primarily used in North America)
 - 1.5 Mbit/s bearer
 - 24x 64kbit/s channels. 23 for voice, 1 for signalling (timeslot 24)
- Common interfaces for ISP dial-in, PBX to carrier trunks, etc.

Interface Types - Digital

- Basic Rate ISDN
 - 144kbit/s bearer
 - 2x 64kbit/s channels + 1x 16kbit/s signalling channel
 - 2B + D
 - B channels = 64kbit/s voice/data channels
 - D channel(s) = signalling data channels

Interface Types - Analog

- Only really two types:
- FXO interface - plugs into your telco (Foreign eXchange central Office)
 - uses FXS signalling!
- FXS interface - plugs into a telephone. e.g. ATAs (Foreign eXchange Station)
 - uses FXO signalling!
- Uses analog signalling, limited to one DDI per line
- Signalling is generally more ambiguous and harder to work with than digital signalling

AS5300 / AS5350 / AS 5400

- Multi-port E1/T1 access servers
- Popular ISP dial-in boxes
- 5300 - can be used for VoIP when loaded with DSP cards
- 5350/5400 has universal ports - modem or VoIP
- Dial-up ISPs often well placed to provide VoIP services
 - POPs in many locations, with the right hardware!

IOS Voice Configuration

- For VoIP we need to configure:
 - voice-port - the voice 'interface'
 - FXS / FXO - e.g. voice-port 1/0/0
 - E1/T1 signalling channel - e.g. voice-port 1/0:D
 - dial-peer - tells the gateway how to connect voice ports to VoIP call legs
- For E1/T1 links we also need to configure the physical bearer
 - controller E1 / controller T1
 - interface serial 0:15 (the signalling timeslot for an E1, 0:23 for T1)

E1 Configuration

```
! This configuration works with Telecom NZ E1 circuits
!
isdn switch-type primary-net5
!
controller E1 0
    clock source line primary
    pri-group timeslots 1-10,16          ! note, timeslots count from 1.
    description Link to Telecom
!
!
interface Serial0:15                    ! note, serial channels count from 0.
    no ip address
    isdn switch-type primary-net5
    isdn incoming-voice modem           ! treats incoming calls as modem or voice
!                                       ! rather than data
!
voice-port 0:D
    echo-cancel coverage 64
    cptone NZ                          ! returns NZ progress tones
    bearer-cap Speech
!
```

T1 Configuration

```
!  
isdn switch-type primary-ni  
!  
!  
controller T1 1/0  
    framing esf  
    linecode b8zs  
    pri-group timeslots 1-24  
!  
!  
interface Serial1/0:23  
    no ip address  
    encapsulation hdlc  
    isdn switch-type primary-ni  
    isdn incoming-voice modem  
!  
!  
voice-port 1/0:D  
    echo-cancel coverage 64  
    ! default cptone is US  
!
```

FXS / FXO Configuration

! Some useful settings

!

voice-port 1/0/0

no comfort-noise

! needs 'no vad' on VoIP dial-peer

cptone NZ

timeouts interdigit 3

! timeout when gathering dialled digits

description Analog phone line

!

! Or, if you're just having a play, the defaults will work:

!

voice-port 1/0/1

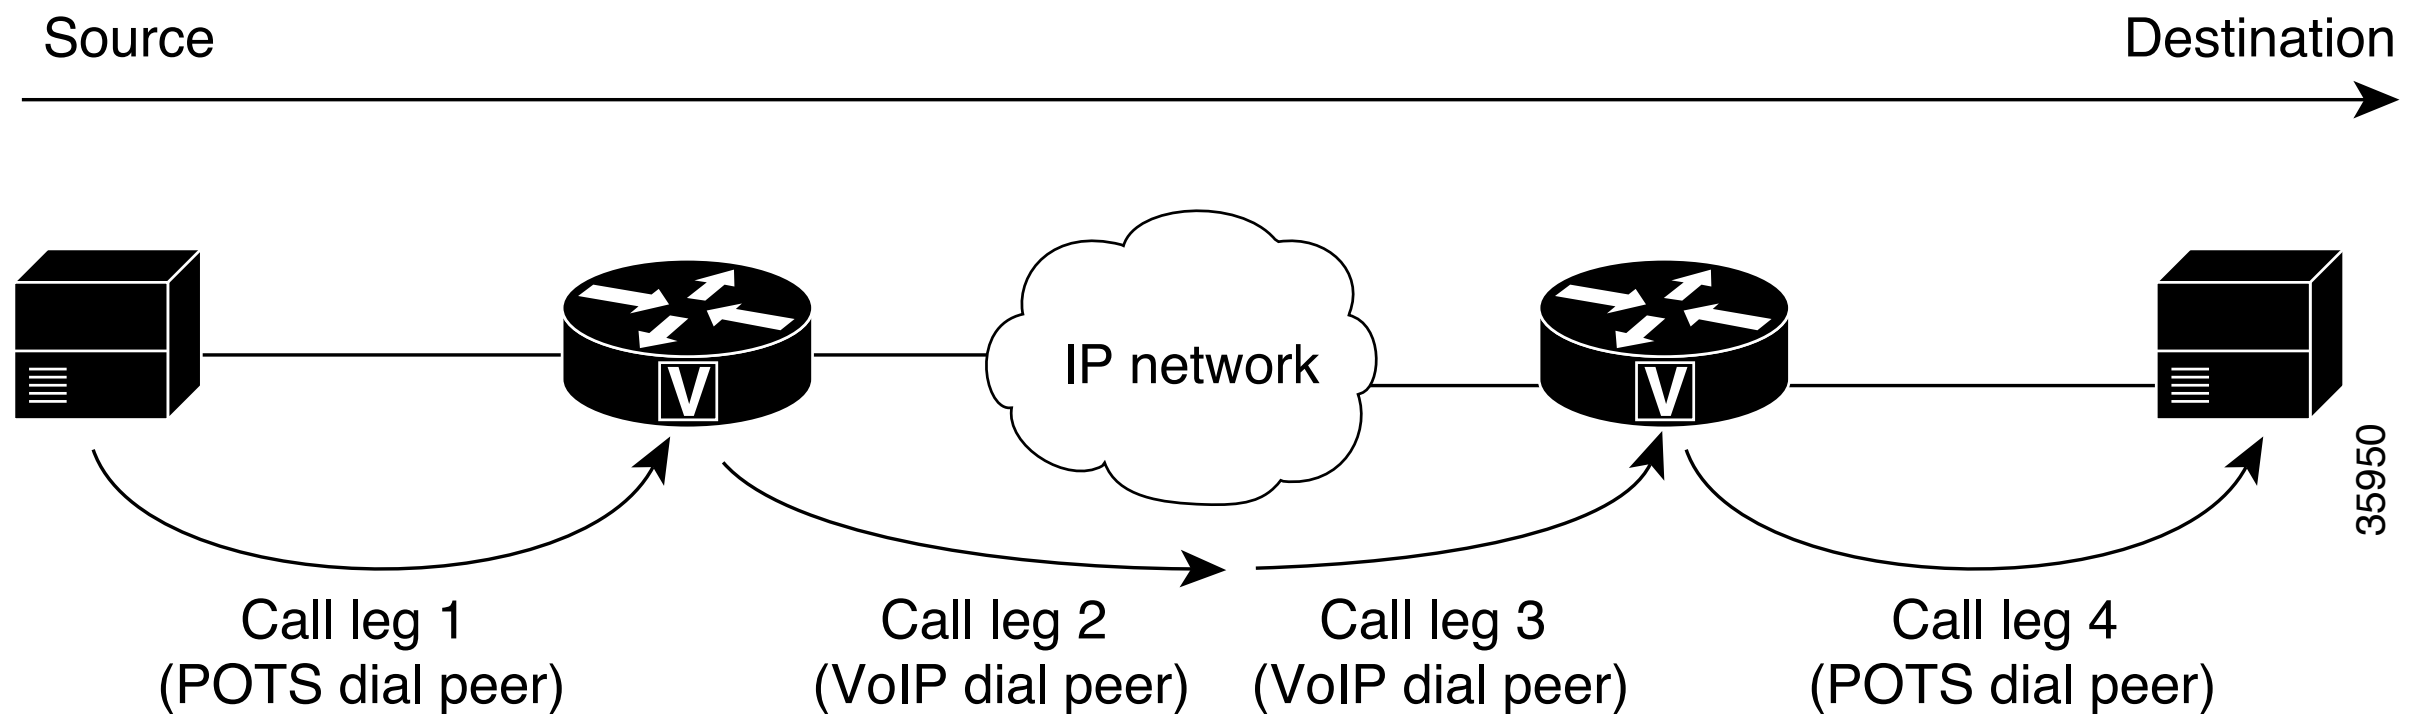

!

Dial Peers

- Basic building block on Cisco voice gateways, the dial-peer
- All calls consists of at least two call legs:
 - Originating device to originating gateway (POTS)
 - Originating gateway to IP network (VoIP)
 - ...and/or
 - IP network to destination gateway
 - Destination gateway to destination device

Dial Peers ...ctd

- Most hardware will also allow TDM switching, i.e. POTS to POTS
 - But not typically VoIP media proxying (i.e. no VoIP-VoIP)

Dial Peer Syntax

```
! POTS dial peer
```

```
!
```

```
dial-peer voice tag pots
```

```
  destination-pattern number
```

```
  port voiceport#
```

```
  other configurable options
```

```
!
```

```
! VoIP dial peer
```

```
!
```

```
dial-peer voice tag voip
```

```
  destination-pattern number
```

```
  session target data address
```

```
  other configurable options
```

```
!
```

```
! Destination pattern = E.164 number (i.e. a telephone number)
```

Dial Peer Matching

- When a call is made, IOS will select the appropriate dial-peer for an outbound leg depending on call direction
 - voip --> pots
 - pots --> voip
- Longest match for *destination-pattern* is chosen
- If multiple longest matches exist, the dial-peer with the lowest *preference* will be chosen

Example POTS Dial Peers

! Outbound send-everything-to-the-pstn POTS dial-peer:

!

dial-peer voice 1 pots

destination-pattern T

! T = digit timeout, i.e. any string of digits

direct-inward-dial

! allow incoming calls from the POTS port also

port 0:D

!

! Only send numbers prefixed with 021 out the POTS port:

!

dial-peer voice 1 pots

destination-pattern 021T

! T = digit timeout, i.e. any string of digits

direct-inward-dial

port 1:D

!

! Only send seven digit numbers prefixed by 04

!

dial-peer voice 1 pots

destination-pattern 04.....

! . = a single digit

direct-inward-dial

port 2:D

!

Example VoIP dial-peers

! Send calls to 4989560 to a VoIP PABX or phone at IP address a.b.c.d

!

dial-peer voice 44989560 voip

destination-pattern 4989560

session protocol sipv2

session target ipv4:a.b.c.d

dtmf-relay rtp-nte

codec g729br8

no vad

!

!

dial-peer voice 2001 voip

huntstop

preference 2

destination-pattern 2001

session protocol sipv2

session target ipv4:202.53.189.62

dtmf-relay rtp-nte

playout-delay mode fixed

codec g711ulaw

no vad

!

! RFC2833 out of band DTMF signalling

! Don't search for a match past this dial-peer

! sets a fixed jitter buffer, useful for Fax

! always use this for fax!

Failover Routing

- Failover routing is achieved by ‘hunting’ on busy, no answer, and a myriad of other causes
- Works for both *pots* and *voip* dial-peers
- Use *preference* to step through dial-peers
 - 0 is best and the default, 9 is worst
- Use *huntstop* on the ‘last’ dial-peer
- Often used in conjunction with *translation-patterns* to ensure correct dial string for different trunks

Failover Example

```
! Incoming POTS calls first try one VoIP server, then failover to another
! if that server doesn't answer or is busy
```

```
!
voice hunt user-busy
voice hunt no-answer
!
dial-peer voice 49896411 voip
 destination-pattern 4989641
 session protocol sipv2
 session target ipv4:a.b.c.1
 dtmf-relay rtp-nte
 codec g711ulaw
!
dial-peer voice 49896412 voip
 huntstop
 preference 1
 destination-pattern 4989641
 session protocol sipv2
 session target ipv4:a.b.c.2
 dtmf-relay rtp-nte
 codec g711ulaw
!
```

Translation Patterns

- Used to translate called and calling numbers
- Uses basic translation rules to prepend / strip digits, translate one number into a completely different number
- Some basic examples...

Translation Pattern Examples

! strip 644 from the start of the number for numbers starting 6442 - 6449

!

translation-rule 100

Rule 2 ^6442..... 2

Rule 3 ^6443..... 3

Rule 4 ^6444..... 4

Rule 5 ^6445..... 5

Rule 6 ^6446..... 6

Rule 7 ^6447..... 7

Rule 8 ^6448..... 8

Rule 9 ^6449..... 9

!

! Prefix 04 to the beginning of any number

!

translation-rule 101

Rule 1 ^.% 04

Translation Pattern Examples ...ctd

```
! translate any number to 0212304323
```

```
!
```

```
translation-rule 120
```

```
Rule 1 any 0212304323
```

```
! Normalise numbers into a standard format
```

```
!
```

```
translation-rule 150
```

```
Rule 1 ^644498.... 498      ! 6444981234    --> 4981234
```

```
Rule 2 ^04498.... 498      !  044981234    --> 4981234
```

```
Rule 3 ^00644498.... 498    ! 006444981234  --> 4981234
```

```
!
```

Apply the Translation Pattern

```
!  
dial-peer voice 44989560 voip  
  destination-pattern 4989560  
  translate-outgoing calling 100      ! translated the CALLING number  
  translate-outgoing called 200      ! translate the CALLED number  
  session protocol sipv2  
  session target ipv4:203.114.148.130  
  dtmf-relay rtp-nte  
  codec g711ulaw  
  no vad  
!
```
